Glass interior partitions today are the most popular way of zoning space in small apartments and other premises. These light, thin, durable barriers allow you to avoid large material and time costs for the construction of brick walls.

Their installation does not require coordination with the legislative authorities, which means that with the help of glass structures you can not only delimit the area of the room, but also embody the most original design ideas.

If you need a glass partition in a room for zoning, the price will be calculated individually, taking into account the type of base material and fittings, the dimensions of the structure, and the presence of additional artistic processing.

Also, the cost of the product depends on its type.

The following types of glass barriers are distinguished:

- according to the type of construction
- frameless and frame;
- in height - full-size or partially zoning;
- by functionality - sliding, with and without a door;
- in shape - straight and curved;
- in thickness - single and triplex.

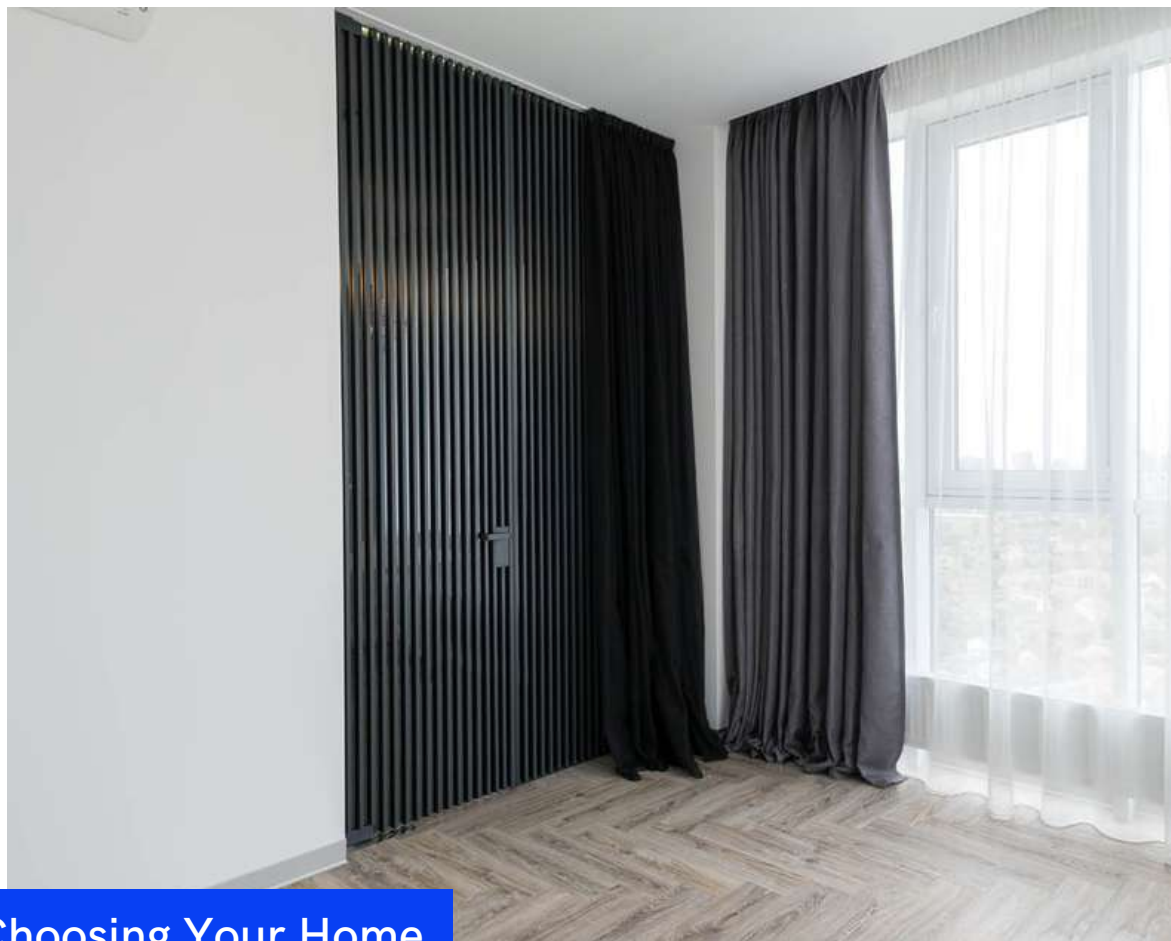

The use of glass partitions for space zoning is extremely wide due to the high strength and safety of the material used. Translucent structures create a favorable atmosphere in the room and protect from extraneous noise.

A glass partition between the kitchen and the living room is often installed in modern apartments, which looks very stylish.

With a small footage of the total area, such a barrier will allow you to create a full-fledged small room - for relaxing and reading, playing with a child, working with a laptop. Glass partitions for zoning are indispensable in the office, where they are used to create separate working sectors, separate recreation and waiting areas, conference rooms. In addition, similar designs can be seen in shopping centers, car dealerships, banks, restaurants.

Choosing Your Home

Interroom partitions made of glass: installation technology to create partitions for glass zoning, various types of glass are used:

- multilayer;
- tempered;
- reinforced (protective);
- jumbo (the largest possible size).

The type of material chosen by the customer is mounted on a durable aluminum profile that is resistant to significant physical stress.

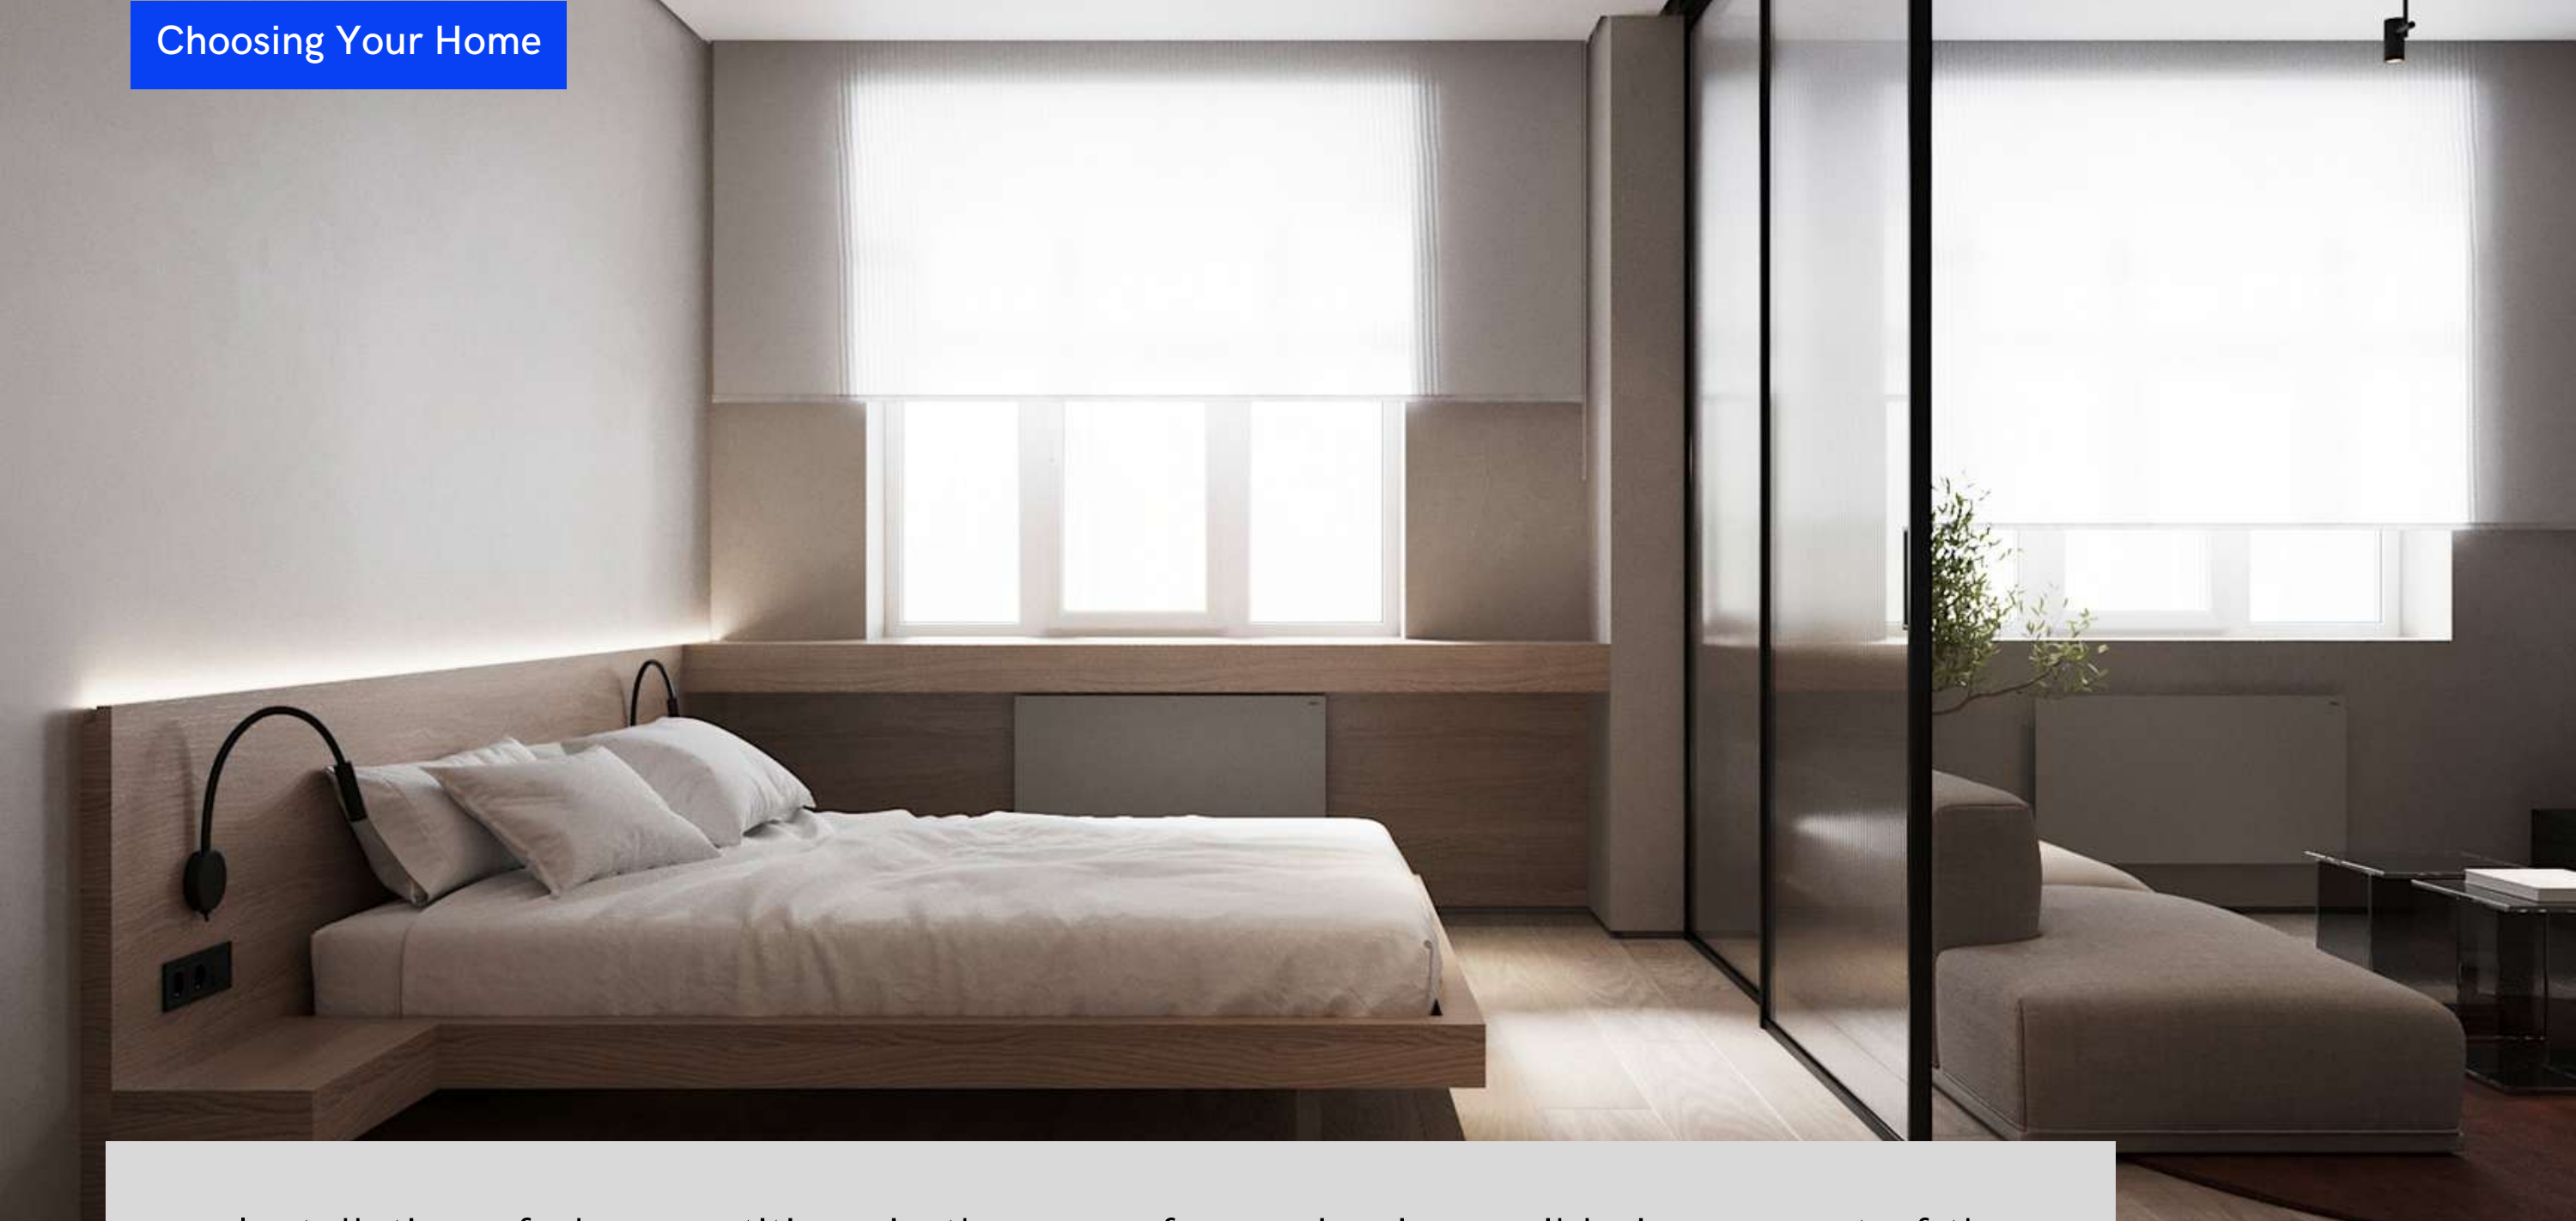

All structural elements, including fittings, are manufactured using the most modern high-tech equipment.

Interroom glass partitions — sliding or other type — have a set of advantages:

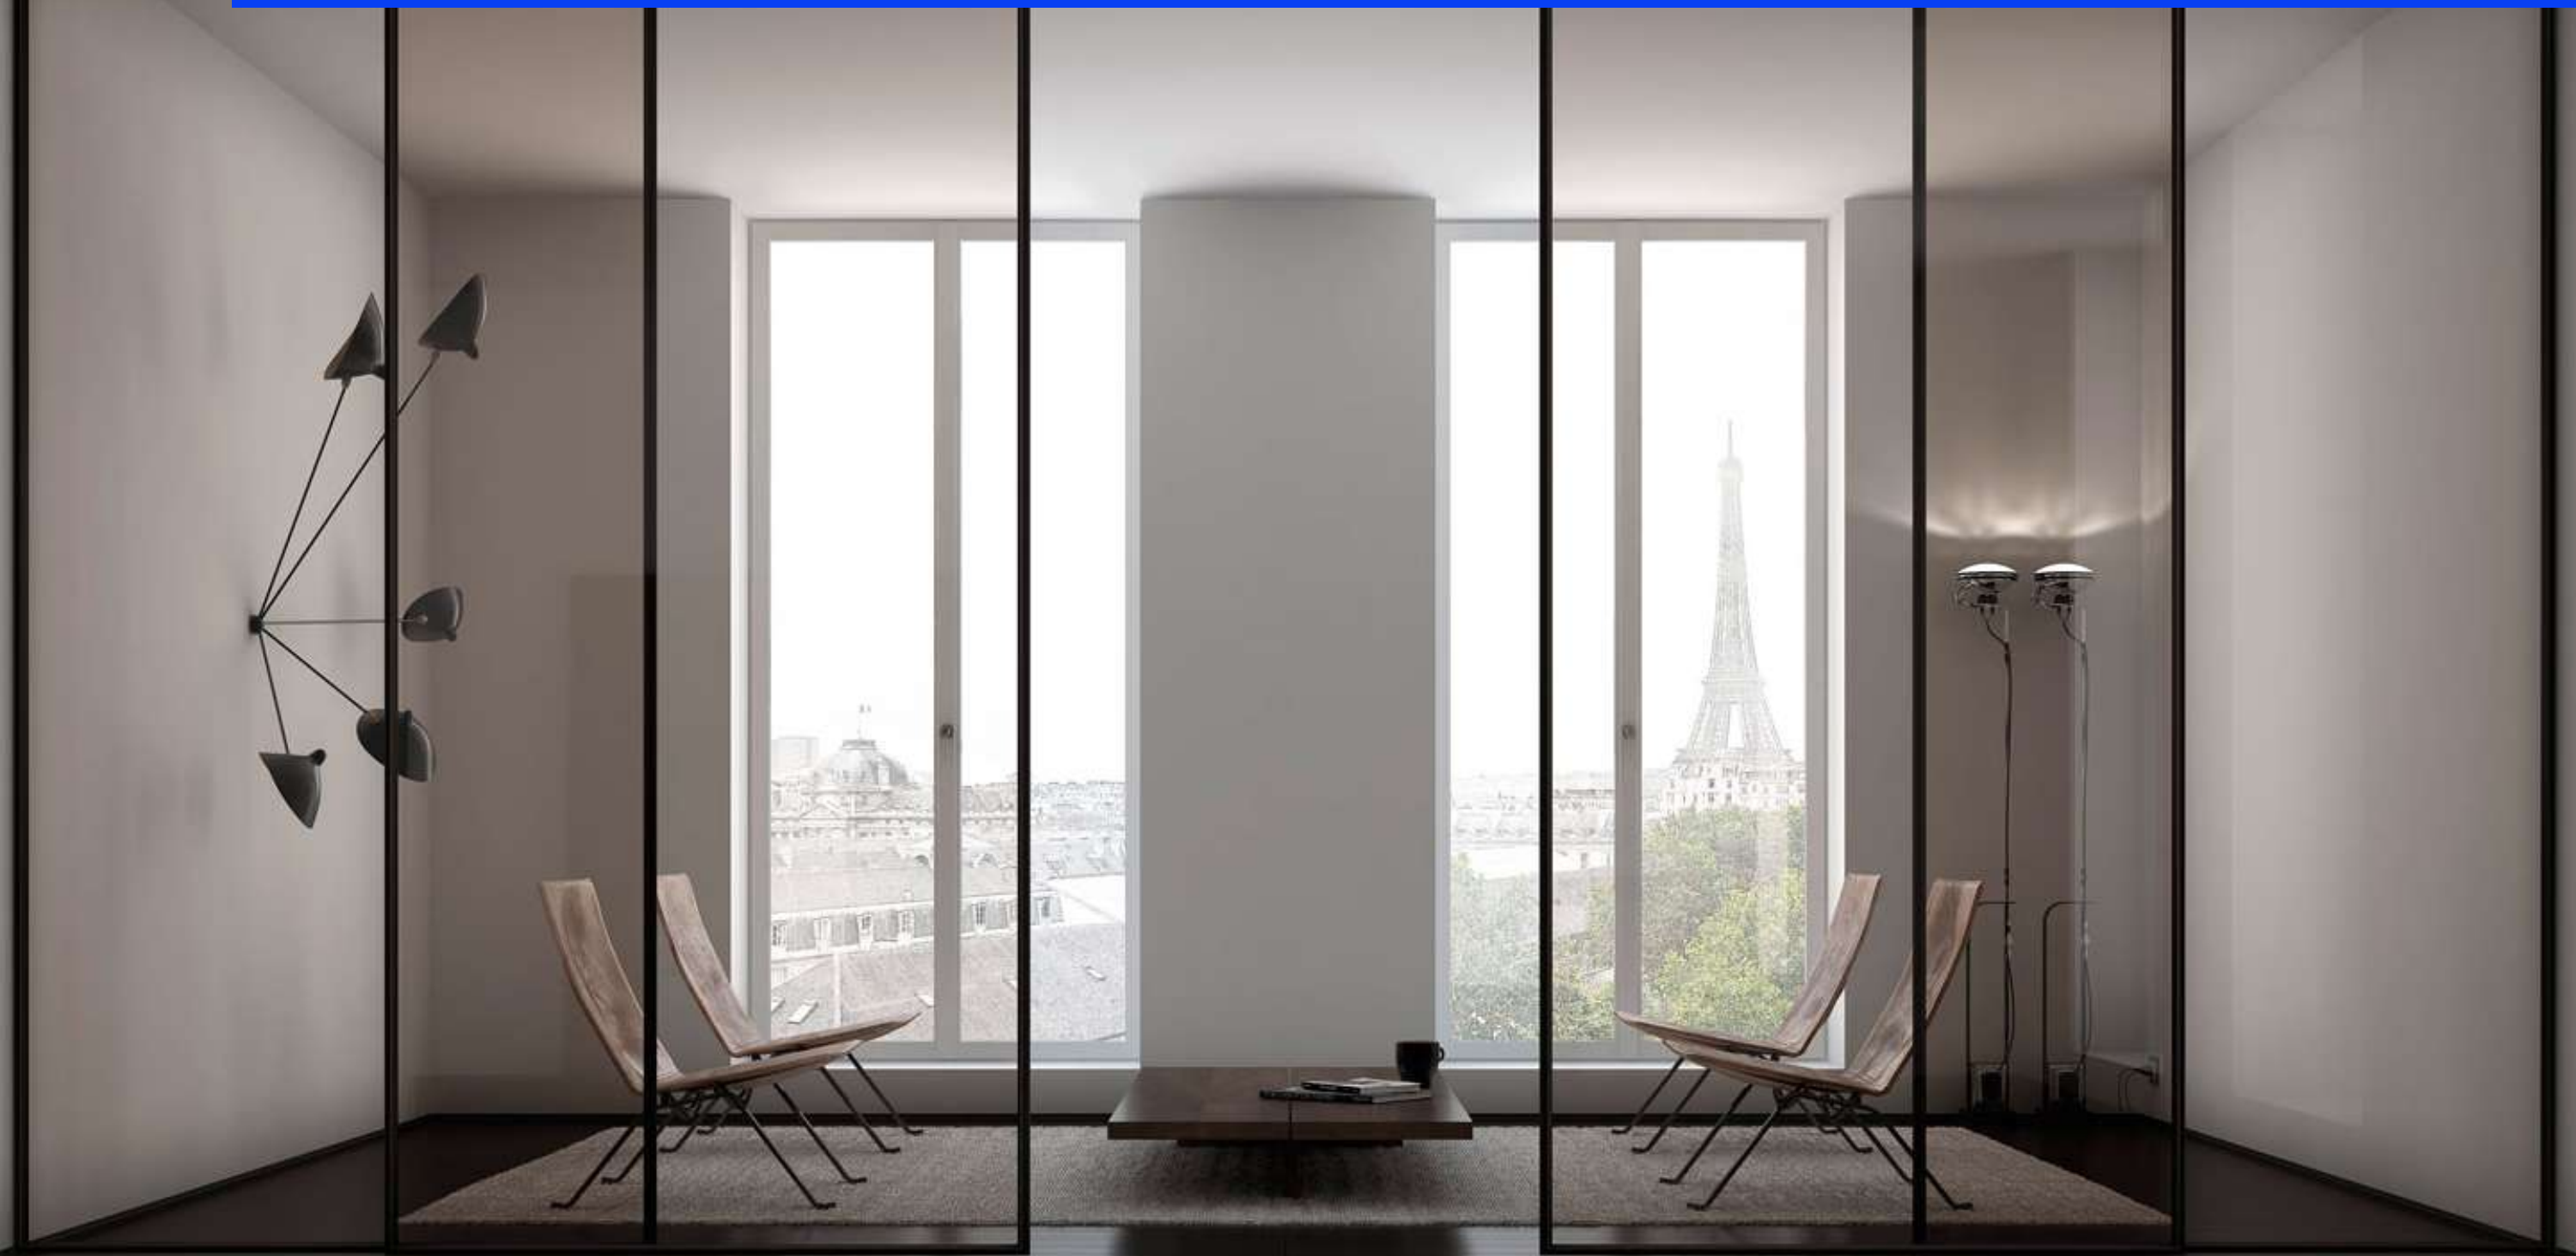

- a possibility of use in rooms of any appointment, including with special loading;
- safety - if the glass can be damaged, the edges of the fragments will not be sharp;
- light transmission and sound insulation;
- durability;
- aesthetic appearance;
- small weight;
- ease of installation;
- visual expansion of space.

Installation of glass partitions in the room for zoning is possible in any part of the room. At the request of the customer, the barrier fabric can be solid or combined - with transparent and tinted parts, blinds, original decor.

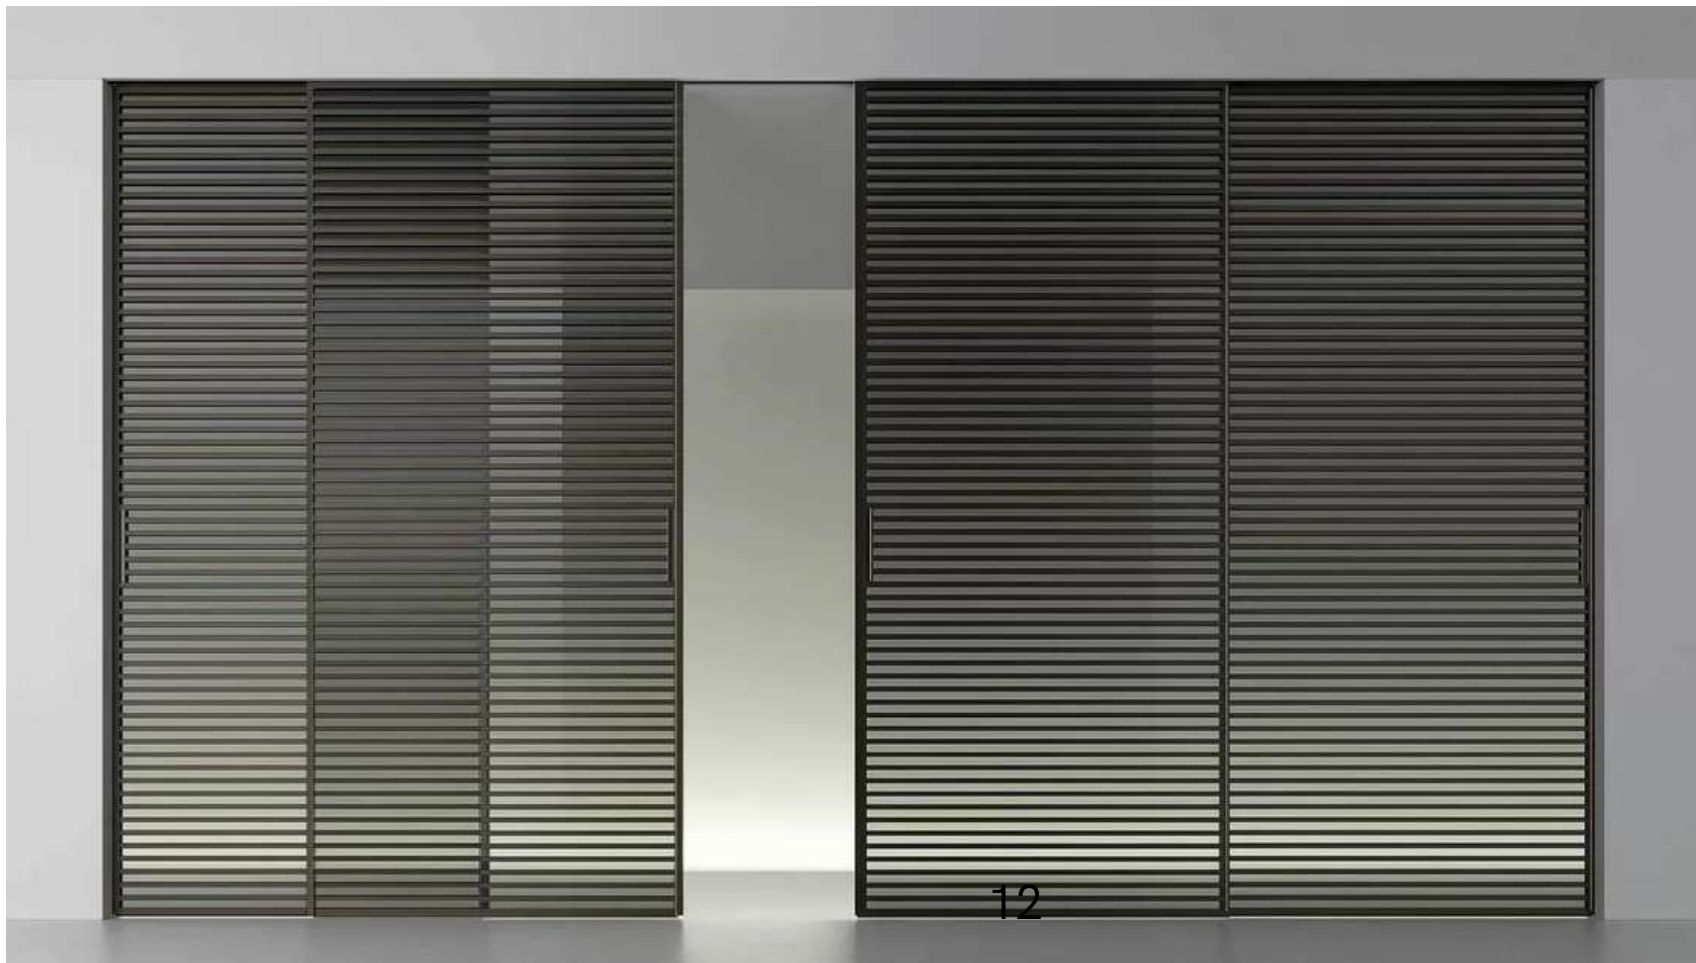

Installation of the structure requires a minimum of time and resources. You can install a fence in an already repaired and used room without fear of spoiling the interior elements.
